

ReactJS.

The Component model

Topics

- **Component State.**
 - **Basis for dynamic, interactive UI.**
- **Data Flow patterns.**
- **Hooks.**
- **Material Design (Styling)**

Component DATA

- **A component has two sources of data:**
 1. **Props - Passed in to a component; Immutable; the props object.**
 2. ***State* - Internal to the component; Causes the component to re-render when changed / mutated.**
 - **Both can be any data type - primitive, object, array.**
- **Props-related features:**
 - **Default values.**
 - **Type-checking.**
- **State-related features:**
 - **Initialization.**
 - **Mutation – using a setter method.**
 - **Automatically causes component to re-render. *****
 - **Performs an overwrite operation, not a merge.**

Stateful Component Example

- **The Counter component.**
- **Ref. basicReactLab samples – sample 06.**
- **The useState() function:**
 - **To declare a state variable.**
 - **Returns a Setter / Mutator method.**
 - **Termed a React hook.**
- **JS features:**
 - **Static function property,**
e.g. defaultProps, propTypes

React's event system.

- **Cross-browser support.**
- **Event handlers receive a SyntheticEvent – a cross-browser wrapper for the browser's native event.**
- **React event naming convention slightly different from native:**

React	Native
onClick	onclick
onChange	onchange
onSubmit	onsubmit

- See <https://reactjs.org/docs/events.html> for full details,

Automatic Re-rendering.

- **EX.: The Counter component.**

User clicks button

→ *onClick event handler executes (incrementCounter)*

→ *component state variable is changed (setCount())*

→ *component function re- executed (**re-rendering**)* 

Topics

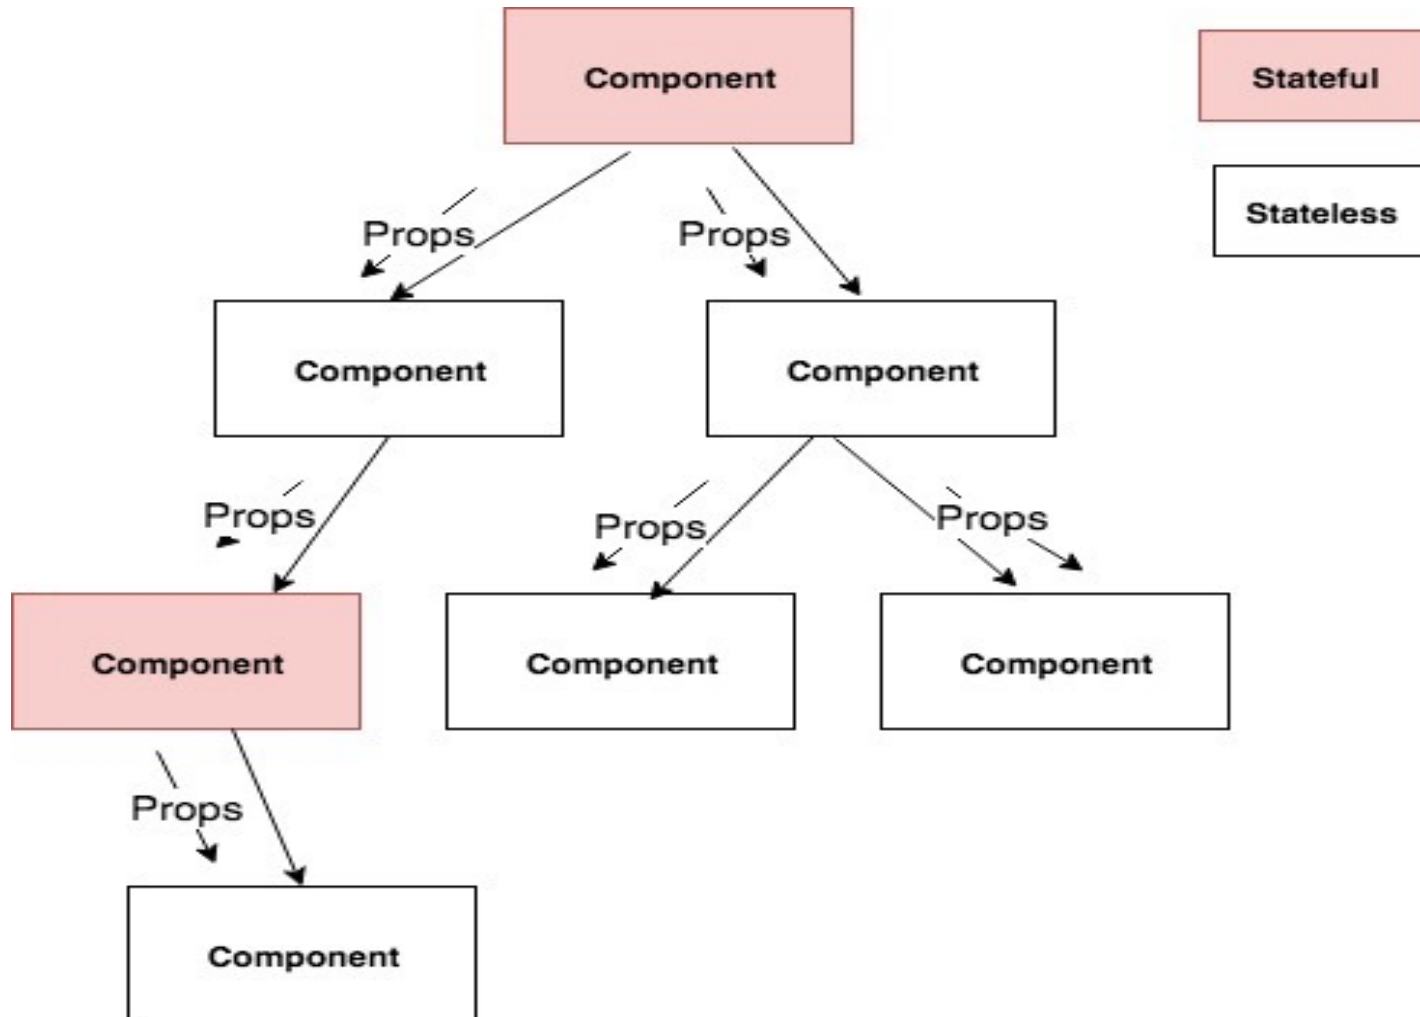

- **Component State.**

- **Data Flow patterns.**

- **Hooks.**

Unidirectional data flow

Unidirectional data flow

- **In a React app, data flows unidirectionally ONLY.**
 - **Most other SPA frameworks use two-way data binding.**
- **Design pattern: A small subset of an app's components are stateful and the rest are stateless.**
- **Typical Stateful component execution flow:**
 1. **A user interaction causes component's state to change.**
 2. **Component re-renders automatically.**
 3. **Component recomputes props and passes them to its subordinate components.**
 4. **Subordinate components re-execute (re-render), and pass recomputed props to its subordinates.**
 5. **etc.**

Topics

- **Component State.** ✓
- **Data Flow patterns.** ✓ *(more later)*
- **Hooks**

React Hooks

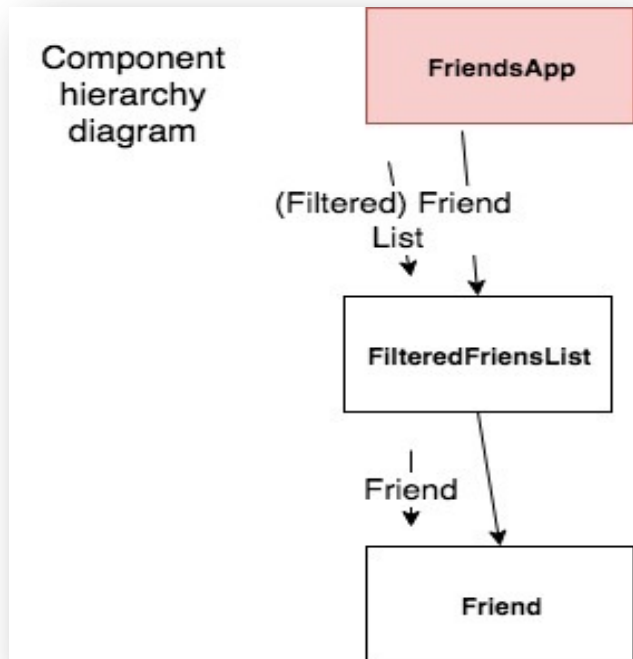

- Introduced in version 16.8.0 (February 2019)
- React Hooks are:
 1. Functions (some HOF).
 2. That allow us to manipulate the state and manage the lifecycle of a component.
 3. (Obviate the need to implement components as classes.)
- Examples: `useState`, `useEffect`, `useContext`, `useRef`, etc
 - ‘use’ prefix is necessary for linting purposes.
- Usage rules:
 1. Can only call hooks at the ‘top level’ in a component.
 - Don’t call hooks inside loops, condition statements, or nested function.
 2. Only Call hooks from React component functions.
 - Don’t call hooks from regular JavaScript functions.

useEffect Hook

- **When a component needs to perform side effects.**
- **Side Effect example:**
 - fetching data from a web API.
 - Subscribe to browser events, e.g. window resize.
- **Signature:** `useEffect(callback, dependency array)`
 - Side effect code is in the callback.
- **Execution times:**
 1. On mounting.
 2. On every rendering where a member of its dependency array has changed value since the previous rendering.
 - An empty dependency array restricts execution to mount-time only.

Sample App

(see lecture archive)

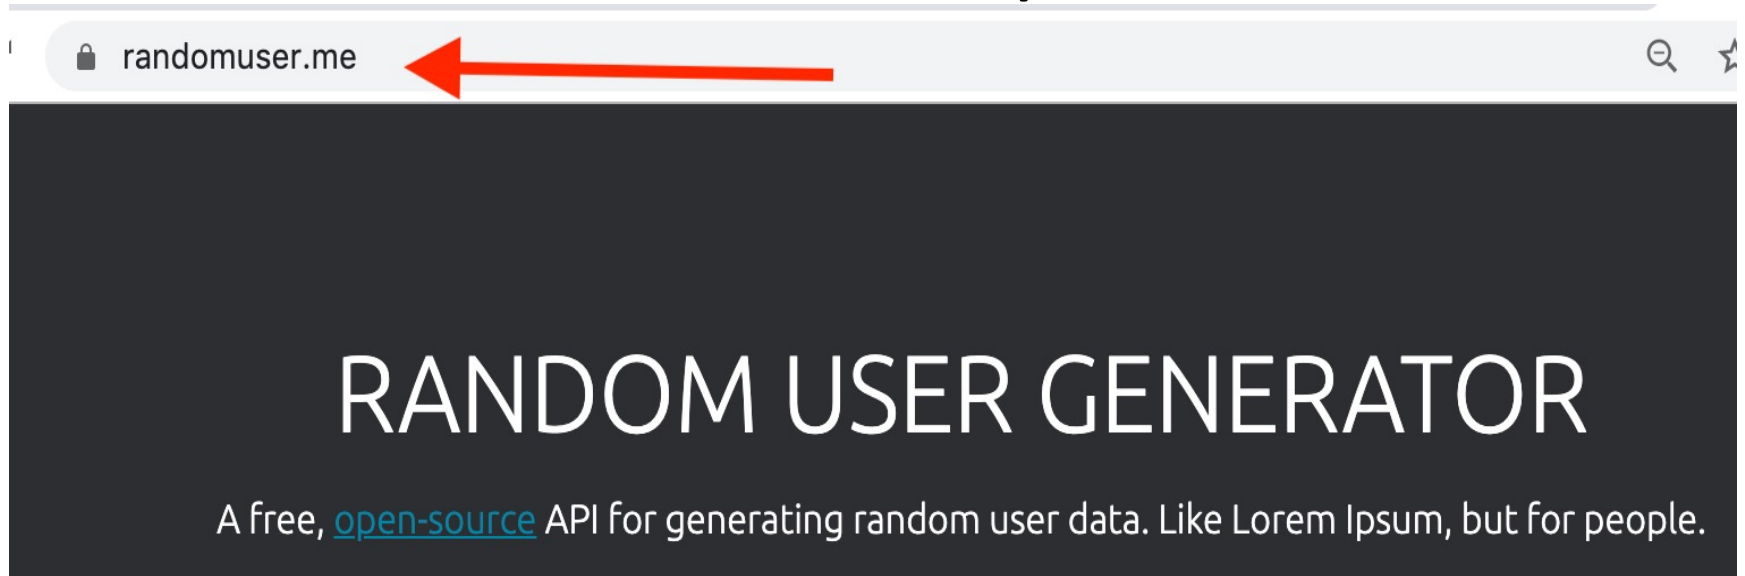

Friends List

- **Joe Bloggs**
jbloggs@here.com
- **Paula Smith**
psmith@here.com
- **Catherine Dwyer**
cdwyer@here.com
- **Paul Briggs**
pbriggs@here.com

FriendsApp component:

1. **Manages app's state** (i.e. text box, full list of friends).
2. **Fetches all friends from a web API** - useEffect.
3. **Computes matching friends.**
4. **Controls list rendering.**

RandomUser open API

- Returns an auto-generated list of user profiles (friends).
- e.g. Get 10 user profiles:

GET <https://randomuser.me/api/?results=10>

Sample App - *useEffect* Hook

- **useEffect runs AT THE END of a component's mount process.**
i.e. First rendering occurs **BEFORE** the API data is available.
- **We must accommodate this in the implementation.**

Friends List

- **Iida Wuori**

iida.wuori@example.com

- **Luke Brown**

[HMR] Waiting for update signal from WDS...

Render FriendsApp

fetch effect

Render FriendsApp

Render FriendsApp

Initial mounting

**After typing 1
character**

Sample App - *useEffect* Hook

- **You must allow for asynchronous nature of API calls**
 - **Do not ‘freeze’ the browser while waiting.**
 - **Enable components to render in the absence of data**

- **Correct solution:**

```
const [friends, setFriends] = useState( [ ] );
```

- **Incorrect solution:**

```
const [friends, setFriends] = useState(null);
```

TypeError: Cannot read property 'filter' of nul

Unidirectional data flow & Re-rendering

(Assume we request 6 friends from web API)

The screenshot shows a web application with a 'Friends List' section. It includes a search input field with the text 'se' and a list of two friends: Malou Jensen and Tobias Larsen, each with an email address. To the right, the DevTools component inspector is open, showing the component tree for the 'Friends List' component. The tree is divided into three sections, each highlighted with a red box. The first section shows the initial render of the 'FriendsApp' component, including the 'Render of FilteredFriendList' and the 'fetch effect'. The second section shows the render after typing 's' in the text box, where the 'Render of Friend' components for Malou Jensen, Melissa Pearson, and Gildo Mendes are shown. The third section shows the render after typing 'e' in the text box, where the 'Render of Friend' components for Malou Jensen and Tobias Larsen are shown. Brackets on the left side of the component tree indicate the scope of each section.

Typed s in text box

Typed e in text box

Unidirectional data flow & **Re-rendering**

- **What happens when the user types in the text box?**

User types a character in text box

→ onChange event handler executes

→ Handler changes a state variable

→ React re-renders FriendsApp component

→ React re-renders children (FilteredFriendList) with new prop values.

***→ React re-renders children of FilteredFriendList.
(Re-rendering completed)***

→ (Pre-commit phase) React computes the updates required to the browser's DOM

→ (Commit phase) React batch updates the DOM.

→ Browser repaints screen

- **Component State.** ✓
- **Data Flow patterns.** ✓ *(more later)*
- **Hooks.** ✓ *(more later)*
- **Material Design**

Material UI.

A 3rd party component library to build high quality digital UIs

Material Design.

- **Material (Design) is a design system created by Google to help teams build high-quality digital experiences for Android, iOS, and web.**
- **A visual language that synthesizes classic principles of good design with the innovation and possibility of technology and science.**
- **Inspired by:**
 - **the physical world and its textures, including how they reflect light and cast shadows.**
 - **the study of paper and ink.**
- **Material is a metaphor.**
 - **Material surfaces reimagine the mediums of paper and ink.**

Material Components.

- **Material Components are interactive building blocks for creating a digital user interface.**
- **They cover a range of interface needs, including:**
 1. **Display: Placing and organizing content using components like cards, lists, and grids.**
 2. **Navigation: Allowing users to move through an application using components like navigation drawers and tabs.**
 3. **Actions: Allowing users to perform tasks using components such as the floating action button.**
 4. **Input: Enter information or make selections using components like text fields and selection controls.**
 5. **Communication: Alerting users to key information and messages using snackbars, banners and dialogues.**

Theming.

- **Material Design does not mean copy Google design.**
- **Material Theming makes it easy to customize Material Design to match the look and feel of your brand, with built-in support and guidance for customizing colors, typography styles, and corner shape.**
- **Color - Material's color system is an organized approach to applying color to a UI. Global color styles have semantic names and defined usage in components – primary, secondary.**
- **Typography - The Material type system provides 13 typography styles for everything from headlines to body text and captions.**
 - **Each style has a clear meaning and intended application within an interface.**

Material UI.

- A React component library based on the Material Design system.
- Components include `<Card />`, `<Box />`, `<Grid />`, `<Menu />`, `<Button />`, `<Icon />`, `<Snackbar />`, `<Typography />`
- Build your own design system, or start with Material Design.
- The CSS-in-JS model.

CSS-in-JS

- **Plain CSS - Separate files for CSS and JS.**

----- CSS. -----

```
.my-header {  
  background-color: lightblue;  
  padding: 10px;  
}
```

Must be
CamelCase

----- JS -----

```
import 'app.css'  
  
.....  
<header  
  className="my-header">  
  .....  
</header>
```

- **CSS-in-JS.**

```
.import { makeStyles } from  
  "@material-ui/core/styles";
```

```
const useStyles = makeStyles(({  
  myHeader: {  
    backgroundColor: "lightblue",  
    padding: "10px"  
  }  
});
```

1

```
.....  
const classes = useStyles();
```

2

```
.....  
<header  
  className={classes.myHeader}>  
  ..... </header>
```

3

Summary

- **Component state.**
 - User input/interaction is 'recorder' in a component's state variable.
 - State changes cause component re-execution -> re-rendering.
 - Re-rendering (may) result in UI changes -> dynamic apps.
- **Hooks – allows us manipulate state variables and hook into the lifecycle of a component.**
 - `useState`, `useEffect`, etc
- **Data only flows downward through the component hierarchy – this aids debugging.**
 - Actions (Events) flow upwards
